Abstract
This study aims to explore how artificial intelligence (AI) impacts customers' buying habits in today's digital marketplace. In today's rapidly evolving artificial intelligence landscape, businesses have embraced the transformative power of technology. These technological advances in the field of artificial intelligence have revolutionized the way businesses communicate with customers and make decisions. The present paper examines and analyzes the changing influence of AI algorithms such as personalization algorithms, predictive algorithms, conversational algorithms, and recommendation systems on various stages of the customer journey, supported by a review of existing literature and primary data collection. The researcher is interested in studying how AI driven Digital marketing tools are used in the following three stages of the consumer buying journey: Pre-Purchase, Purchase, and Post-Purchase in Delhi NCR region based on this research. The study aims to explore how these AI-enhanced digital tools influence consumer actions in the pre-purchase, purchase, and post-purchase phases. The study was carried out with SPSS version software in analyzing data and testing the research hypothesis employed the correlation technique and regression technique, in this case the data were obtained by filling and directing the questionnaire to the public and structured and openly fabricated without making them look like questionnaires. Based on the analysis of this study, several valuable insights can be drawn for marketers looking to tap into AI implementation strategies while addressing consumer apprehensions amidst a largely AI-powered digital world. In a landscape where AI is becoming integral to the digital sphere, the conclusions of this study offer valuable analysis for marketers aiming to make the most of strategies for implementing AI without causing consumer concern.

Keywords: Artificial Intelligence, Consumer Behaviour, Personalization Algorithms, Digital Marketing

Introduction

The digital marketing industry is undergoing a transformation thanks to the advent of AI and machine learning. AI and machine learning are revolutionizing the digital marketing scene. AI is the ever-changing technology that has the potential to transform marketing strategies. The marketers wish to have an edge in the online marketing industry where the number of marketers is increasing literally by the day. The optimization of business growth and marketing campaigns are now being revolutionized by AI as are customer experiences. This technology revolution has changed the way companies communicate with their customers and their experience of the buying process, should that journey take place in a healthy digital economy. Today, customer journeys are as diverse as they are Omnichannel, and as such, there is no more Omnichannel Experience but a lot of Customers-Brand interactions. AI-powered tools flourish by interacting with, understanding, and utilising vast amounts of consumer data to create persuasive, timely, and engaging marketing content. When it comes to marketing, AI is the umbrella term for a range of technologies, including machine learning algorithms for identifying trends and patterns in consumer data, natural language processing (NLP) that enables chatbots and voice-activated search, computer vision for visual recognition and augmented reality shopping, predictive analytics for anticipating consumer needs, and recommendation systems that leverage past purchasing habits and preferences to forecast future needs. The AI technology impacts all stages of consumer buying. At the awareness level, AI systems can identify potential demands before the customers know that they need them. AI systems at the awareness level can spot possible demands before consumers know them. Personal Recommendation engines are driven by artificial intelligence to shape product discovery and evaluation during information search and analysis. Simplified checkout systems and tailored incentives help to lower friction during buying decisions. AI contributes to improving customer satisfaction by developing advanced loyalty initiatives and customer support after purchase. Marketing technologies and customer behaviour are dynamic and mutually dependent when it comes to artificial intelligence. Consumers create data that trains and enhances AI systems as they engage with them, forming an always-changing feedback loop .AI is mainly concerned with consumer retention and lead conversion in digital marketing. With the increasing intelligence and independence of AI systems in marketing

applications, it is important to define ethical standards and governance structures to ensure responsible development and implementation. Furthermore, AI technology is evolving rapidly, and marketers need to master new skills to leverage it for success. This paper aims to thoroughly review how artificial intelligence is transforming the marketing landscape and its effect on consumer buying behavior. It also explores new trends and research avenues in which AI meets marketing. By synthesizing existing studies and identifying spatial gaps, this study seeks to enhance the understanding of AI's transformative influence on marketing theory, which is acting as a catalyst in producing an outcome called a satisfied customer.

Literature Review

Integration of artificial intelligence in digital marketing has developed in several stages. Marketers are using AI to increase client demand. Artificial Intelligence (AI) is emerging as a transformative force in digital marketing, revolutionizing consumer behaviour analysis, personalization strategies, and overall marketing effectiveness. Clients are showing positive experiences through market applications integrated with machine intelligence similar to human intelligence. (Duan 2020) Many studies have shown the multilevel integration and impact of AI on various marketing strategies, which is potentially re-shaping the landscape of consumer buying behaviour driven by innovation, personalization, and many more. Data understanding is important for tracking the patterns of material recommended to customers by ML algorithms. Basic predictive models backed simple recommendation systems and client segmentation in the 1990s and 2000s. Machine learning advanced natural language processing and picture identification capabilities between 2010 and 2018. From "analytics 2.0" to "analytics 3.0," major platforms, including Google, Facebook, and Amazon built powerful algorithms for personalization and ad targeting, transforming their offerings. Deep learning and reinforcement learning have enabled increasingly contextually aware marketing systems since 2018. ((Martin and Murphy, 2017). The role of AI is focused on enhancing consumer experience and engagement, which is becoming a key theme in recent research. AI is majorly dominating customer engagement in different buying stages of consumer buying behaviour. Personalized interactions with tools such as chatbots, virtual assistants, Alexa, and Siri are helping to deliver personalized interactions (Bilal et al., 2023). These AI-driven digital marketing tools provide instant responses, customer queries, and offer personalized product recommendations based on trends and historical data. Customer feels that they are valued and important to the company, thus by using these tools they are making their customers more satisfied with the company's services and more loyal to it.

Furthermore, AI can be used to analyse data in real-time, offering marketers valuable insights into customer behaviour and preferences (Ziakis & Vlachopoulou, 2023). An AI algorithm can process enormous amounts of data from different sources and identify patterns and trends, which is beyond the capacity of human beings. This has enabled marketers to create more targeted and effective marketing campaigns and maximize marketing budgets, while improving overall ROI. Another main focus of interest is the utilization of AI in predictive analytics and decision-making. AI algorithms have been found to be accurate in predicting market trends and consumer demand, enabling businesses to make informed decisions and optimize their resources (Potwora et al., 2024). The predictive power can be applied to a number of marketing activities like creating content, targeting ads, optimizing campaigns, etc. AI can, for example, review previous campaign metrics and data to determine which creative components, messaging, and channels will be most effective for which audience groups, enabling marketers to customize their campaigns for maximum engagement. Several studies have examined the ethical challenges and dilemmas surrounding AI in marketing.A few studies have delved into the ethical issues and conundrums of AI in marketing. Some challenges are recognised as being important, such as privacy concerns, data security, and transparency of AI algorithms (Alves et al., 2023). With the advancement of AI systems and their ability to process more sensitive consumer information, the ethical use of AI and consumer trust are crucial. The researchers reiterate the need to set clear guidelines and regulations for the use of AI in marketing areas, as well as consumer awareness of the use of their data and its protection. Incorporating AI with other technologies, such as big data analytics and the Internet of Things (IoT), have been explored for enhancing marketing strategies. It has been found that such integration can result in more advanced customer segmentation and targeted marketing approaches (Ding et al., 2023). AI's integration with IoT devices enables marketers to collect real-time data about consumer behavior and preferences in physical spaces, thus unifying online and offline marketing. This all-encompassing strategy allows for a more cohesive and tailored customer journey throughout the entire touchpoint. There have also been studies that have focused on the effect of AI on certain types of marketing. In the realm of social media marketing, for example, AI has been found to boost engagement rates and content relevance (Abbasi et al., 2022). Social Media AI tools can process and analyze social media trends, sentiments, and user-generated content to guide content creation and distribution. AI has proven to be useful in improving product suggestions and customizing shopping experiences in e-commerce (Payne et al.,

2020). Customers' browsing habits, purchase history, and even weather conditions and time of day can be tracked by AI algorithms, resulting in personalized product suggestions that can greatly improve conversion rates and customer satisfaction. Another interest area has been the influence of AI on the consumer decision-making process. Studies have shown that AI recommendations can have a significant effect on purchase decisions and consumer behavior (Chen et al., 2024). AI can present consumers with customised options and relevant data at key stages of their decision-making process to help them make a purchase that's in line with their personal preferences and needs. But research also suggests a balance between personalisation and consumer autonomy, there needs to be transparency and consumers need to be in control of their data and the recommendations they receive. While the benefits of AI in the marketing field are well documented, there are certain challenges to contemplate. These include the need for skilled personnel, significant initial investments, and the complexity of integrating AI into existing marketing infrastructures (Miklosik et al., 2019). The challenges need to be tackled by organizations as they work towards unlocking the potential of AI, which may include upskilling their staff, redesigning data structures, and fostering an innovative and experimental approach. It can change the way customer segmentation and targeting are done, or how content is created and optimized — and other areas of marketing. However, it also underscores the importance of ethical and practical challenges to overcome to harness the full potential of AI in marketing. Future studies should focus on the long-term implications of AI in consumer trust, the use of AI in new markets, and the possibilities of AI to develop more sustainable and social responsible marketing. Furthermore, researchers can develop ethical guidelines for using AI in marketing, review the impact of AI on marketing team organization and processes, and investigate the possibilities of using AI to solve world marketing problems in a connected and evolving world.

Problem statement

Research is focused on how AI can be embraced in digital marketing tools, which will foster innovation and improve productivity in the coming years. The researcher wants to investigate the relationship between these AI-enabled tools and consumer buying behaviour. AI, along with ML and DL, is revolutionizing the market scenario, which can analyse data and provide analytical tools.

Need for study

Due to rapid advancements in technology and intrusive customers, there is a need to understand consumers' choices and preferences and provide them with new AI-enabled tools that are there in marketing. Major artificial intelligence marketing applications like personalizing engines, recommendation systems, predictive analytics, conversational interfaces, and programmatic advertising platforms are dominant in enticing buying behaviour. There is a need to understand how these tools impact consumers' buying stages.

Objectives

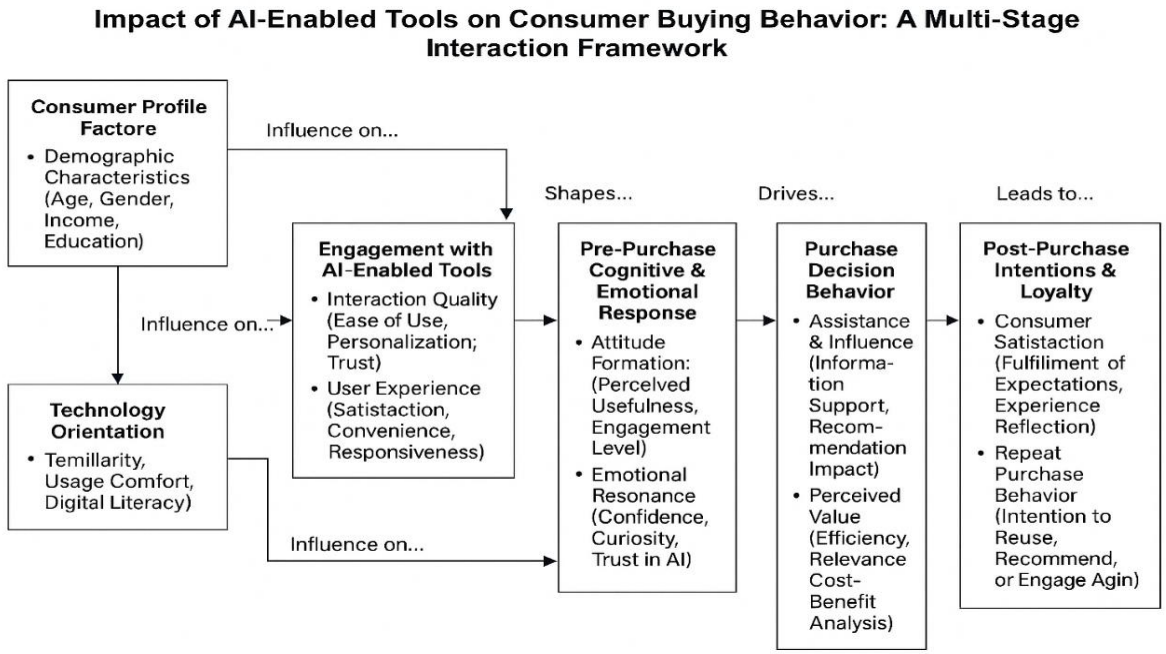
The research aims to achieve the following key objectives:

- To analyse the influence of AI-enabled digital marketing tools on consumer decision-making processes across different stages of the buying journey, namely pre-purchase, purchase, and post-purchase stages.
- To evaluate the effectiveness of various AI-powered digital marketing tools in shaping consumer perceptions, preferences, and purchase intentions across diverse demographic segments

Conceptual Model

The research aims to conceptualize the linkage between Consumer buying behaviour and AI-enabled digital marketing interface, which consumers will exhibit in three different stages, namely Pre-Purchase, Purchase, and Post-Purchase stages of consumer buying behaviour as exhibited in Figure 1. In the given model, Technological familiarity is explained as an antecedent, and Attitude, behaviour, and intentions are explained as construct of the model.

Figure 1 - Conceptual model



Source: Author's own

Antecedents to the model

Antecedents are the consumer-related factors that influence how individuals engage with AI-enabled tools. Demographics such as age, gender, income, and technology orientation—comprising digital literacy, experience, and comfort with technology—significantly affect AI adoption (Venkatesh et al., 2003; Pantano & Pizzi, 2020). Consumers with higher digital competence tend to engage more positively with AI systems, demonstrating greater trust and openness to automated assistance.

Interface of the model

The interface represents the direct interaction between consumers and AI-enabled tools, serving as the key mediator. It encompasses two main dimensions: interaction quality (usability, personalization, trustworthiness) and user experience (satisfaction, responsiveness) (Grewal et al., 2020; Xu et al., 2020). A high-quality interface increases user engagement, trust, and perceived value, translating antecedents into meaningful behavioural responses.

Consequences of the model

Consequences refer to behavioural outcomes following the AI interaction. These span across three stages: pre-purchase represented by Attitude, Purchase represented by behaviour, and post-purchase exhibited by Intention (Lemon & Verhoef, 2016; Davenport et al., 2020). Effective AI interfaces enhance decision quality and build loyalty by shaping positive consumer experiences throughout the buying journey

Hypothesis

To test the relevance of the research objectives, the following hypotheses are tested

- **H1**: There is a significant negative relationship between age and engagement with AI-enabled digital marketing interfaces.
- **H2**: Female buyers are more satisfied with the AI-enabled digital marketing interface than male buyers
- **H3**: There is a positive relation between Income level and user interaction with AI-enabled digital marketing interfaces.
- **H4**: Education level influences the likelihood of adopting AI-enabled digital marketing interfaces.

Pertaining to hypotheses H1, H2, H3, H4, many studies in the past have been done showing that the role of these demographic factors, like education, young customers, and income level, has a positive relationship with establishing an interface with digital technologies.

- **H5**- Consumers, who are more technologically familiar, have a more satisfying interface with AI-enabled digital marketing tools.
- **H6**- The more positive the consumer interface with AI-enabled digital marketing tools, the more favourable will be their attitudes in the pre-purchase stage.
- **H7**- The more satisfying the consumer interface with AI-enabled digital marketing tools, the more favourable will be their behaviour in the Purchase stage
- **H8**- The more satisfying the consumer interface with AI-enabled digital marketing

tools, the higher will be their intention in the post-purchase stage.

Research Methodology

Schwardt (2007) has defined research methodology as a theory or procedure of how an inquiry or research should proceed. It involves analysis of the hypothesis, principles, and procedures in a particular method to the problem. The methodology was based on primary results from consumers and secondary research from past year studies.

Sample Size

To test the validity of the hypotheses of the study, primary data were collected using a structured, undisguised questionnaire. The questionnaire was administered using Google Forms to 220 participants. The response rate recorded was 80%. The target population was consumers from different age categories from the Delhi-NCR region, targeted using convenience sampling.

Period of study

As it was a cross-sectional study, the temporal period of the study was from January 2026 to March 2026. Primary data was collected for 3 months using Google Forms in a structured, undisguised questionnaire. The questionnaire was divided into two sections. The first section sought information about the demographic characteristics of the respondents, and the second section consisted of 12 items on a five-point Likert scale to measure the Impact of consumer buying behaviour with AI-enabled digital marketing tools. These items were adapted from past-year studies.

Methods used

The researcher used SPSS version to find out the impact of variables on consumer buying behaviour. The data was analysed using Mean, Std. Deviation and applying correlation and regression. The questionnaire was pre-tested by pilot study on 50 members after that reliability of each scale was assed using Cronbach 'alpha coefficient. Results are shown in the following tables presented.

Descriptive Statistics

Table 1: Demographic Profile of Respondents in Delhi NCR Region (N = 182)

Category	Response	Frequency	Percent
1. Gender	Male	82	45.1%
	Female	100	54.9%
2. Age Group	18 - 24	46	25.3%
	25 - 34	55	30.2%
	35 - 44	36	19.8%
	45 - 54	27	14.8%
	55 and above	18	9.9%
3. Education Level	High School	36	19.8%
	Bachelor's Degree	91	50.0%
	Master's Degree	36	19.8%
	Doctorate	9	4.9%
	Other	9	4.9%
4. Occupation	Student	18	9.9%
	Professional	73	40.1%
	Skilled	36	19.8%
	Administrator	18	9.9%
	Self-employed	18	9.9%
	Retired	9	4.9%
	Others	9	4.9%
5.Technological Familiarity	Highly Familiar	73	40.1%
	Moderately Familiar	82	45.1%
	Slightly Familiar	18	9.9%
	Not Familiar	9	4.9%
6. Income Level (Monthly)	Less than ₹25,000	27	14.8%
	₹25,000 - ₹49,999	46	25.3%
	₹50,000 - ₹74,999	55	30.2%
	₹75,000 - ₹99,999	36	19.8%
	₹1,00,000 and above	18	9.9%

The above table represents descriptive statistics from the SPSS version of 182 respondents. The statistics showed us the 6 broader demographic factors, namely gender, age group, education level, occupation, technological familiarity, and income level. The respondents were mainly dominated by female, 54.09%, whereas males were 45.01% of the total sample size. More than 50% of respondents belonged to the category of 18-34 years, showing responses from young customers., More than 50% of the respondents belonged to the graduation level categories.

The majority of the respondents were using AI-enabled digital tools for making purchase decisions, ranging from highly familiar to moderately familiar**.** The responses from people received based on their income level were mainly dominated by the category 25000-100000.
Reliability was also tested using Cronbach's alpha coefficient in SPSS. The results generated from Cronbach's alpha coefficients are as follows-

Table 2 - Reliability Analysis of Scales Used

Variable	Source	Scale items	Cronbach's alpha value
Perceived Benefits	Davis (1989) - Technology Acceptance Model (TAM)	4	0.684
Purchase Decision Influence	Chatterjee (2021); Kietzmann (2018); Venkatesh & Davis (2000)	8	0.662

Findings of the study
The analysis was completed by running our data set in SPSS version. The researcher employed the Karl Pearson correlation coefficient, and the regression was computed to effectively find out the impact of AI-enabled digital tools on consumer buying behaviour. Among the variables, technological familiarity as an antecedent shows a significant impact on the AI-enabled digital marketing interface. Various constructs, such as three stages defined by attitude, behaviour, and intention for pre-purchase, purchase, and post-purchase, respectively, showed a significant impact on the results. The results for the correlation are as follows

Table 3- Correlation table

Variables	Mean	Standard Deviation	Correlation with AI-enabled Tools Interface
Age	2.05	0.53	-0.115
Gender	1.48	0.49	-0.128
Income	2.30	0.95	0.075
Education	3.35	1.00	-0.050
Technological Familiarity	3.92	1.05	0.286**
Attitude	2.57	0.68	0.271**
Behaviour	3.08	0.48	0.221**

Note: ** Correlation is significant at the 0.01 level (1-tailed).

Results from the above table have shown that there exists a nonsignificant correlation with these four demographic factors, like Age, Gender, Income, Education, and AI-enabled digital tools interface; these correlation values show a weak correlation between these variables. A significant positive correlation (**$r = 0.286$, $p < 0.01$**) is seen between technological familiarity, showing that users familiar with technology are more likely to favour AI-enabled digital tools. Attitude ($r = 0.271$), Behaviour ($r = 0.221$), and Intention ($r = 0.301$) also show positive and significant correlations at $p < 0.01$, indicating that favourable attitudes, behaviours, and intentions has a significant impact on three different stages
H1, H2, H3, and H4 have no significant relation with the results, so they stand rejected. But also, it was observed from the results that H5, H6, H7, and H8 are supported by the evidence and the results generated from the survey.

Table 4: Results

Hypothesis	Statement	Result
H1	There is a significant negative relationship between age and engagement with AI-enabled digital marketing interfaces.	Rejected
H2	Female buyers are more satisfied with the AI-enabled digital marketing interface than male buyers.	Rejected
H3	There is a positive relation between income level and user interaction with AI-enabled digital marketing interfaces.	Rejected
H4	Education level influences the likelihood of adopting AI-enabled digital marketing interfaces.	Rejected
H5	Consumers who are more technologically familiar have a more satisfying interface with AI-enabled digital marketing tools.	Supported
H6	The more positive the consumer interface with AI-enabled digital marketing tools, the more favourable will be their attitudes in the pre-purchase stage.	Supported

H7	The more satisfying the consumer interface with AI-enabled digital marketing tools, the more favourable will be their behaviour in the purchase stage.	Supported
H8	The more satisfying the consumer interface with AI-enabled digital marketing tools, the higher will be their intention in the post-purchase stage.	Supported

Table 5: Regression results
To interpret the cause-and-effect relationship, single linear regression was employed in SPSS. The results are as follows:

Independent Variable	Dependent Variable	R^2	Beta Standardized Coefficient	T Statistics	P-Value
Technological familiarity	AI-enabled digital tools interface	0.090	0.320**	4.100	<.001
AI-enabled digital tools interface	Attitude	0.080	0.310**	3.900	0.001
AI-enabled digital tools interface	Behaviour	0.100	0.350**	4.250	<0.001
AI-enabled digital tools interface	Intention	0.070	0.250*	3.100	0.004

**Correlation is significant at 1% level
*Correlation is significant at 5% level

Results of the regression analysis revealed that technological familiarity significantly positively influences the user's engagement with the AI-based digital marketing interface (R^2 = 0.090; β = 0.320; t = 4.100; p < .001). This indicates that consumers who are more technology-savvy are more effective in using AI tools and are more satisfied with them. Additionally, the results show that a favorable perception at the pre-purchase stage, which is measured by consumer attitudes, has a significant positive relationship with the interfaces that have AI capabilities (R^2 = 0.080, β = 0.310, t = 3.900, p = 0.001). Likewise, there was a positive, strong correlation between AI interface satisfaction and consumer behaviour in the purchase phase (R^2 = 0.100, β = 0.350, t = 4.250, p < .001), showing that a positive AI interface experience is related to more desirable purchase behaviours. Finally, the interaction experience was shown to have a significant influence on post-purchase intention (R^2 = 0.070, β = 0.250, t = 3.100, p = 0.004) albeit having a comparatively smaller effect size. In summary, all relationships examined were statistically significant, highlighting the importance of technological familiarity and satisfaction with AI interfaces on various stages of the consumer purchase process.

Conclusion
This study offers a thorough understanding of the effects of digital marketing tools offered by artificial intelligence on consumer purchase behaviour. Though having different processes and efficacy across environments, the results show that these technologies significantly affect all phases of the consumer experience, from pre-purchase to post-purchase interaction. A complex interaction of demographics, perceived benefits, and Purchase decision influences moderates consumer responses to artificial intelligence marketing, which has great relevance. The above research has shown that AI-enabled tools are shaping consumer buying stages, each stage has an impact of these tools starting from product recommendations, dynamic pricing in pre pre-purchase stage, buying assistance, price comparison, neuromarketing in the Purchase stage, and followed by chatbot services, personalized review emails in post post-purchase stage. Research has shown that there is a high cause-and-effect relationship between the three variables and the interface, paving the way to understand the role of AI in this digital marketing arena. This research is trying to provide implications to the marketer that if they want to stand out in this highly competitive world, they should focus on transforming AI capabilities in this dynamic consumer-driven space.

Future Scope and Limitations
Future studies should look at the development of cross-cultural AI marketing frameworks, the growing influence of multimodal and generative artificial intelligence applications, and the longitudinal impacts of AI marketing exposure on consumer decision-making capability. With constant shifts in the regulatory landscape, ongoing research into compliance strategies that enhance rather than hinder the consumer experience is particularly crucial. By embracing responsible innovation, both performance and ethical

considerations can be leveraged to create marketing experiences that benefit both businesses and consumers, all powered by AI. AI technologies and tools are constantly evolving, and new technologies that have been developed since the research cutoff date may not be addressed, or tools and applications mentioned in this study may be superseded.
