Abstract
Augmented Reality (AR), Virtual Reality (VR) and other immersive technologies are reshaping the manner in which brands communicate with, engage and sell to consumers in the digital marketplace. Moving beyond static images and two-dimensional video, these technologies allow marketers to construct interactive, three-dimensional and highly personalised brand experiences that blur the boundary between the physical and the digital worlds. This paper examines the emerging role of AR, VR and immersive technologies, including the metaverse, in digital marketing. Drawing upon a review of more than twenty peer-reviewed studies, industry reports and conference papers, the paper traces the evolution of immersive marketing, synthesises the theoretical and empirical literature on consumer engagement, purchase intention, brand experience and trust, and identifies the key application areas of AR/VR in retail, advertising, tourism and the metaverse. A descriptive, secondary-data-based research methodology is adopted, supported by a structured review of the extant literature. The findings suggest that immersive technologies significantly enhance consumer engagement, perceived enjoyment, brand recall and purchase intention, while also raising concerns relating to cost, accessibility, privacy and technology readiness. The paper concludes with suggestions for marketers, technology developers and policymakers on how to responsibly harness AR, VR and immersive technologies for sustainable digital marketing growth, and outlines directions for future research.

Keywords: Augmented Reality; Virtual Reality; Immersive Technology; Digital Marketing; Metaverse; Consumer Behaviour; Virtual Try-On

1. Introduction

Digital marketing has undergone several waves of transformation over the last two decades — from static websites and search engine marketing, through social media and mobile marketing, to today's data-driven and highly personalised digital ecosystems. The newest and arguably most disruptive wave is the emergence of immersive technologies, namely Augmented Reality (AR), Virtual Reality (VR), Mixed Reality (MR) and the broader Extended Reality (XR) ecosystem, culminating in the concept of the metaverse.

AR overlays computer-generated content — text, images, three-dimensional models or animations — onto a live view of the physical world, typically through a smartphone camera or a wearable headset. VR, in contrast, immerses the user in a fully computer-generated environment that replaces the physical world altogether, usually experienced through a head-mounted display. Together, these technologies enable brands to move away from passive, one-way communication towards experiential, two-way and highly interactive engagement with consumers.

Global brands such as IKEA, Sephora, Nike, L'Oréal and Gucci have already deployed AR-based virtual try-on applications, VR showrooms and metaverse storefronts to let consumers visualise, customise and "experience" products before purchase. Industry estimates suggest that spending on AR and VR in marketing and retail continues to grow rapidly as hardware becomes cheaper, 5G connectivity expands and consumers — particularly Millennials and Generation Z — increasingly value experiences over mere possessions.

Despite this growing adoption, academic understanding of how immersive technologies influence consumer psychology, engagement and purchase behaviour is still developing, and the literature remains scattered across marketing, information systems, retailing and tourism journals. This paper attempts to consolidate this dispersed body of knowledge into a single, structured review, and to examine the strategic implications of AR, VR and immersive technologies for the future of digital marketing.

The paper is organised as follows. Section 2 presents a review of the literature and states the objectives of the study. Section 3 outlines the research methodology. Section 4 presents the findings and discussion. Section 5 concludes the paper, and Section 6 offers suggestions for practitioners, educators and future researchers, followed by the bibliography.

2. Literature Review

The literature on AR, VR and immersive marketing can broadly be organised into five thematic streams: (a) foundational and technology-acceptance studies, (b) AR in retail and virtual try-on, (c) VR in experiential and brand marketing, (d) the metaverse and virtual-world marketing, and (e) systematic reviews and meta-analyses that synthesise the field as a whole.

2.1 Foundational and Technology-Acceptance Perspectives

The theoretical foundation for much of this research rests on the Technology Acceptance Model (TAM) proposed by Davis (1989), which posits that perceived usefulness and perceived ease of use determine users' behavioural intention to adopt a new technology. This model has been repeatedly extended in the AR/VR marketing literature to include hedonic constructs such as enjoyment, informativeness and trust. Carmigniani et al. (2011) provided one of the earliest comprehensive surveys of AR technology, systems and applications, describing the technical challenges of moving AR from laboratories into industry, including retail and marketing. Dacko (2017) argued that AR represents a new business-to-consumer marketing paradigm capable of reshaping how brands deliver information and value to consumers, particularly through mobile applications.

González and Blanco (2019) conducted a literature review of the impact of AR on consumer behaviour and found consistent evidence that AR enhances perceived value, engagement and purchase intention, though they also cautioned about novelty effects that may fade over time. Similarly, Ekmeil et al. (2021) examined how AR and VR contributed to business transformation in digital marketing during the COVID-19 pandemic, noting that immersive technologies helped bridge the physical distancing gap between brands and consumers when in-store experiences were restricted.

2.2 AR in Retail, Advertising and Virtual Try-On

A substantial and rapidly growing stream of literature focuses on AR-based virtual try-on (VTO) applications in fashion, cosmetics and apparel retail. Javornik et al. (2016) were among the first to study the shopper experience of a "magic mirror" AR make-up application, finding that the playful, mirror-like interaction increased engagement and enjoyment. Poushneh and Vasquez-Parraga (2017) demonstrated that AR has a discernible impact on retail customers' experience, satisfaction and willingness to buy, establishing an early empirical link between AR features and purchase-related outcomes.

Baek, Yoo and Yoon (2018) examined the "virtual mirror" phenomenon and found that self-viewing through AR, moderated by narcissistic tendencies, shapes consumer responses to advertising. Plotkina and Saurel (2019) studied virtual try-on and physical appearance in apparel mobile retailing, showing that VTO tools improve consumers' confidence in fit and reduce purchase uncertainty. Building on the AR-marketing systematic review tradition, Chylinski et al. (2020) proposed that AR marketing represents a technology-enabled approach to "situated" customer experience, in which digital content is embedded within the consumer's real, physical context.

More recent studies have quantified these effects using structural equation modelling. Aslam and Davis (2024) analysed consumer expectations and experiences of AR apps in the fashion retail sector and found that realism and interactivity were the strongest predictors of satisfaction. In the cosmetics category, an Italian study using the TAM framework on 634 consumers found that perceived informativeness and ease of use predict trust and behavioural intention, with perceived enjoyment acting as a key mediator (Frontiers in Virtual Reality, 2025). A related Emerald-published study using an extended TAM model on 228 Italian respondents found that perceived enjoyment, innovativeness and perceived environmental benefits significantly shape consumer attitudes toward virtual try-on technology and online purchase intentions.

Further extending the TAM framework, a 2025 study published in Young Consumers integrated Innovation Diffusion Theory with two psychological constructs — fit confidence and body esteem — to explain 388 U.S. female consumers' adoption intentions toward AR-based virtual try-on, finding that both technological and psychological antecedents jointly explain adoption. A 2025 study in the Journal of Promotion Management similarly found that AR interactivity, aesthetics and reality congruence enhance personalisation and enjoyment, with consumers responding more strongly to the utilitarian than the hedonic aspects of AR shopping. A large-scale study in Multimedia Tools and Applications (2025) applied Stimulus-Organism-Response theory to show that VTO features shape consumers' affective states, which in turn drive purchase intention in apparel retail, while a further comparative study on AR-based online shopping found that AR experiences outperform conventional web-based shopping modes in improving user experience and online purchase intention through the mediating roles of perceived ease of use and perceived usefulness.

2.3 VR and Immersive Brand Experience

Turning to virtual reality, Grigorovici and Constantin (2004) conducted early experimental work on interactive advertising in three-dimensional gaming environments, finding that immersive, game-based ad placements produced stronger brand effectiveness than conventional rich-media advertising. Loureiro, Guerreiro and Ali's (2019)

framework, published in Frontiers in Psychology, proposed a rigorous methodological agenda for studying VR in marketing, arguing that Extended Reality (XR) technologies can replicate the sensory richness of physical retail environments and that more methodologically sound empirical studies are needed to validate their effects on consumer experience.

A more recent study collated in the Open Access Library Journal ("Immersive Horizons: VR and AR in Digital Marketing") used neuromarketing techniques such as EEG and fMRI to analyse emotional and cognitive responses to VR marketing stimuli, concluding that VR's immersive qualities significantly enhance consumer trust, brand loyalty and purchase intent relative to traditional digital marketing methods.

2.4 The Metaverse and Virtual-World Marketing

The most recent and rapidly expanding stream of literature concerns marketing within the metaverse — persistent, three-dimensional virtual worlds that combine AR, VR, blockchain and social technologies. Barrera and Shah (2023), in a widely cited Journal of Business Research article, conducted a systematic review of 164 marketing-focused, metaverse-associated academic articles and proposed a four-dimensional conceptualisation of the metaverse comprising online collaboration, high consumer immersion, unique digital assets and digital personas. They cautioned that, given the market was projected to reach roughly USD 800 billion by 2024, brands risk entering the metaverse without adequate customer, retailer or brand-level understanding.

Belk, Humayun and Brouard (2022) examined the economic underpinnings of the metaverse, including NFTs, cryptocurrencies and Web3 marketplaces, raising important questions of ownership and value in virtual commerce. Hadi, Melumad and Park (2024), writing in the Journal of Consumer Psychology, positioned the metaverse as a "new digital frontier" for consumer behaviour, arguing that avatars, digital ownership and social presence fundamentally change how consumers relate to brands online.

Kaur et al. (2024) reviewed consumer behaviour in the metaverse and highlighted its potential for enhanced social connection, community building, self-expression and identity exploration, while noting that marketing and advertising applications remain an emerging rather than mature area of practice. A 2025 International Journal of Consumer Studies systematic review by Yin and Do, using the SPAR-4-SLR protocol across 48 eligible articles, confirmed that immersive experience, technology acceptance and interaction patterns are the dominant themes shaping metaverse consumer behaviour research, while also identifying a continued shortage of empirical (as opposed to conceptual) studies.

On the darker side of metaverse marketing, a 2025 study in Global Business and Organizational Excellence proposed an integrative "bright and dark side" framework identifying six key themes: increased digital innovation, new marketing possibilities, consumer interest, threatened digital privacy and legal challenges, health concerns, and sustainability issues — underscoring that immersive marketing is not without risk. Complementing this, a 2025 study in the Journal of Strategic Marketing surveyed 378 participants engaging with a branded virtual environment on the Decentraland platform and developed a Brand-Consumer Metaverse Exchange (BCME) model, finding that passive brand experience, consumer individualism and ideal self-concept significantly shape metaverse brand experience, with consumer innovativeness acting as a mediator.

Sector-specific applications have also been documented. Gursoy, Malodia and Dhir (2022) examined the metaverse's implications for hospitality and tourism marketing, while a systematic review in tourism marketing catalogued the metaverse's building blocks for destination marketing organisations, concluding that very few tourism-specific studies existed prior to 2022 despite the sector's obvious experiential fit with immersive technology.

2.5 Systematic Reviews and Meta-Analyses

Perhaps the most authoritative synthesis to date is the large-scale meta-analysis published in the European Journal of Marketing (2026), which integrated effect sizes from 206 papers comprising 235 independent studies drawn from top marketing journals including the Journal of Marketing, Journal of Retailing and Journal of Consumer Research. This meta-analysis compared the effects of AR versus VR, examined both positive and negative consumer outcomes, and identified contextual moderators, providing a generalisable model of how immersive technologies influence customer responses.

At the AR-specific level, a widely cited systematic literature review in Frontiers in Psychology (2022) analysed 99 journal articles indexed in the Web of Science, finding that AR marketing research has grown rapidly, is dominated by quantitative survey- and experiment-based designs, and is concentrated in three application areas: retail, tourism and advertising. Complementing the marketing-side literature, technology-focused reviews of AR systems have catalogued the hardware, display and interaction challenges that must be resolved before AR can move from prototype to mass-market marketing deployment.

Taken together, the literature converges on several consistent findings: (i) AR and VR enhance consumer engagement, enjoyment, trust and purchase intention relative to conventional digital marketing formats; (ii) these effects are frequently mediated by perceived usefulness, ease of use, enjoyment and

informativeness, in line with extended TAM models; (iii) virtual try-on and situated AR experiences are especially effective in fashion, cosmetics and retail contexts; (iv) VR and the metaverse offer richer, more immersive brand experiences but remain constrained by cost, hardware accessibility and privacy concerns; and (v) empirical, rigorous research — as opposed to conceptual or exploratory work — remains comparatively scarce, particularly for VR and metaverse marketing outside of retail.

2.6 Objectives of the Study

Building on the gaps identified in the literature reviewed above, the present study is guided by the following objectives:

1. To trace the evolution and conceptual scope of AR, VR and immersive technologies within the domain of digital marketing.

2. To review and synthesise the existing academic literature on the impact of AR and VR on consumer engagement, brand experience, trust and purchase intention.

3. To identify the major application areas of immersive technologies in digital marketing, including retail, advertising, tourism and the metaverse.

4. To examine the opportunities, challenges and risks associated with the adoption of immersive marketing technologies.

5. To offer practical suggestions for marketers, brands and future researchers on the strategic use of AR, VR and immersive technologies.

3. Research Methodology

3.1 Research Design

This study adopts a descriptive and analytical research design based entirely on secondary data. Given that the objective of the paper is to synthesise and critically evaluate the existing body of knowledge on AR, VR and immersive technologies in digital marketing, a systematic narrative literature review approach was considered most appropriate, rather than primary data collection.

3.2 Sources of Data

Secondary data were drawn from peer-reviewed journal articles, conference proceedings and systematic literature reviews published in reputed academic databases and publishers, including Frontiers, Emerald Publishing, Elsevier ScienceDirect, Springer, Wiley Online Library, Taylor & Francis, IOPscience and ResearchGate, along with reports referenced within these sources. Search terms used included combinations of "augmented reality", "virtual reality", "immersive technology", "metaverse", "digital marketing", "consumer behaviour", "virtual try-on" and "brand experience".

3.3 Selection Criteria

Articles were selected based on their relevance to marketing and consumer-behaviour applications of AR/VR/immersive technologies, recency (with a preference for studies published between 2016 and 2026), and their appearance in indexed, peer-reviewed journals or recognised conference proceedings. A minimum of twenty distinct research papers, spanning foundational technology-acceptance studies, retail and virtual try-on research, VR brand-experience studies, metaverse marketing research and systematic reviews/meta-analyses, were included to ensure breadth of coverage.

3.4 Method of Analysis

The selected literature was analysed thematically. Studies were grouped into five thematic clusters (foundational/technology-acceptance, AR retail/VTO, VR brand experience, metaverse marketing, and systematic reviews/meta-analyses), and within each cluster, findings were compared and synthesised to identify convergent patterns, points of disagreement, and gaps for future research. This thematic-synthesis approach is consistent with standard practice in marketing literature reviews.

3.5 Limitations of the Methodology

As a literature-based study, this paper does not generate new primary empirical data and is therefore subject to the limitations inherent in the underlying studies reviewed, including differences in sample composition, geographic context, measurement scales and research design across the sources cited. The findings should accordingly be read as a synthesis of the current state of knowledge rather than as new empirical evidence.

4. Findings and Discussion

4.1 Enhanced Consumer Engagement and Enjoyment

Across nearly all the studies reviewed, AR and VR consistently outperform conventional digital marketing formats in generating consumer engagement and enjoyment. Interactive, playful features such as AR mirrors and virtual try-on tools increase the time consumers spend with a brand and the emotional intensity of that interaction, which in turn positively influences attitudes toward the brand and the advertised product.

4.2 Purchase Intention and Behavioural Outcomes

A recurring finding is that AR and VR positively influence purchase intention, often mediated by constructs such as perceived usefulness, perceived enjoyment, informativeness, trust and reduced purchase-decision uncertainty. Virtual try-on applications, in particular, appear to reduce the perceived risk associated with online apparel and

cosmetics purchases by allowing consumers to preview fit, colour and style before buying, which several studies link directly to higher conversion and lower return rates.

4.3 Brand Experience, Trust and Loyalty

VR-based and neuromarketing studies indicate that immersive brand experiences generate stronger emotional and cognitive engagement than traditional digital marketing, translating into higher brand trust and loyalty. In the metaverse context, brand experience is shaped by more complex psychological constructs such as consumer self-concept, individualism and innovativeness, suggesting that metaverse marketing requires more sophisticated, identity-aware strategies than conventional AR/VR retail applications.

4.4 Sector-Specific Applications

The literature identifies fashion, cosmetics and apparel retail as the most mature application areas for AR-based virtual try-on, while hospitality, tourism and gaming are identified as high-potential but comparatively underexplored sectors for VR and metaverse marketing. Across sectors, mobile-based AR applications dominate over headset-based VR applications, largely due to lower cost and higher consumer accessibility.

4.5 Challenges and Risks

Despite these benefits, the reviewed literature also surfaces significant challenges. These include the high cost of VR hardware and content development, uneven consumer access to compatible devices, data-privacy and surveillance concerns arising from immersive tracking technologies, potential health effects such as motion sickness or eye strain from prolonged VR use, and sustainability concerns linked to the energy and resource intensity of metaverse infrastructure. Several studies also caution that the novelty effect associated with new immersive formats may diminish over time, meaning that engagement gains observed in early studies may not be sustained as AR and VR become commonplace.

4.6 Research Gaps

The literature review also reveals that empirical, quantitative research specifically on VR and metaverse marketing remains comparatively limited relative to AR-based retail research, and that most studies are concentrated in Western and East Asian markets, with limited representation from South Asian and other emerging markets. This suggests a clear opportunity for context-specific research in markets such as India, where smartphone-based AR is more accessible than VR hardware.

5. Conclusion

Augmented Reality, Virtual Reality and the broader family of immersive technologies are no longer peripheral novelties in digital marketing; they represent a structural shift in how brands construct, deliver and monetise consumer experiences. This paper has reviewed more than twenty academic studies spanning foundational technology-acceptance research, AR-based retail and virtual try-on studies, VR brand-experience research, metaverse marketing literature, and systematic reviews and meta-analyses. The synthesis confirms that immersive technologies meaningfully enhance consumer engagement, enjoyment, trust and purchase intention, and that these effects are consistently mediated by perceived usefulness, ease of use and enjoyment, in line with extended Technology Acceptance Model frameworks.

At the same time, the literature makes clear that immersive marketing is not a cost-free or risk-free proposition. Issues of cost, accessibility, data privacy, potential health effects and the sustainability of metaverse infrastructure must be carefully managed if brands are to realise the full potential of these technologies without alienating consumers or regulators. As hardware costs decline, 5G and cloud infrastructure mature, and consumer familiarity with immersive formats grows, AR, VR and the metaverse are likely to move from experimental marketing campaigns toward mainstream, integrated components of the digital marketing mix. The future of digital marketing, therefore, will increasingly be defined not merely by what brands say to consumers, but by the immersive experiences they are able to create with them.

6. Suggestions and Recommendations

Based on the findings of this review, the following suggestions are offered to marketers, brands, technology developers, educators and future researchers:

1. Start with low-cost, mobile-based AR applications (such as virtual try-on) before investing in expensive VR or metaverse infrastructure, particularly for small and medium-sized brands with limited marketing budgets.

2. Design immersive experiences around perceived usefulness, ease of use and enjoyment simultaneously, since the literature shows that purely novelty-driven immersive campaigns lose effectiveness once the initial novelty wears off.

3. Build robust data-privacy safeguards and transparent consent mechanisms into AR/VR applications, given consumers' heightened sensitivity to tracking and biometric data collected through immersive technologies.

4. Prioritise sectors with a strong experiential fit — such as fashion, cosmetics, home décor, tourism and hospitality — when planning AR/VR marketing investments, based on the sector-specific evidence reviewed in this paper.

5. Invest in consumer education and accessible design, ensuring that immersive marketing tools remain usable for consumers with varying levels of digital literacy and device access, particularly in emerging markets such as India.

6. Encourage further empirical, quantitative research on VR and metaverse marketing in South Asian and other under-represented markets, to validate whether findings from Western and East Asian studies generalise to different cultural and infrastructural contexts.

7. Adopt a long-term, integrated view of immersive technology as part of the overall digital marketing strategy, rather than treating AR/VR campaigns as one-off, experimental novelties disconnected from core brand and customer-relationship objectives.
